Trans. of Zhurnal Eksperimental'noy i Teoreticheskoy Fiziki (USSR) 1946, v. 16, no. 4, p. 365-368.

A reversible chemical reaction, or a delayed excitation of part of the heat capacity of the gas, caused a sharply pronounced expansion of the shock wave front. The structure of the front depends on the wave amplitude (on the ratio of the wave velocity to the maximum velocity of the sound). This effect is suggested as a means for studying the transfer of energy onto the internal degrees of freedom of molecules.
